

Q3.5 Normal Distribution of Errors

The model’s errors should follow a normal distribution. We evaluate this with a Q-Q plot and a histogram.

Normality of Residuals
Dots should fall along the line

The histogram of the residuals is heavily right-skewed and not bell-shaped. On the Q-Q plot, the points deviate significantly from the theoretical diagonal line, especially in the right tail. This indicates the residuals have heavier tails than a normal distribution.

The assumption of normally distributed errors is clearly violated, likely due to the presence of large-brained outliers.
